Subject: Post-Closure Maintenance and Monitoring Report

This letter serves as the Post-Closure Maintenance and Monitoring Report that documents the results of the monitoring required by the Massachusetts Department of Environmental Protection (DEP), as documented in the "Filed" Deed Notices for the Southeast Construction Fill Area (SCFA) and the Beneficial Use Determination (BUD) Area. This report documents the results of the following post-closure monitoring:

- Groundwater Monitoring (Documented in Attachment 1)
- Surface Water Monitoring (Documented in Attachment 1)
- Soil Stability Monitoring – Settlement, Cracks and Erosion and Vegetative Cover (Documented in Attachment 2)

Should you require additional information please contact me at 413-424-5261 Extension 303.

Sincerely,

YANKEE ATOMIC ELECTRIC CO

1.0 INTRODUCTION

MACTEC Engineering and Consulting, Inc. (MACTEC) has been contracted by The Yankee Atomic Electric Company to conduct the Post Closure Groundwater and Surface Water Monitoring Program at the Yankee Nuclear Power Station, located at 49 Yankee Road in Rowe, Massachusetts (YNPS).

YNPS completed its decommissioning in 2007, under the regulatory oversight of the Nuclear Regulatory Commission (NRC). However, as part of the closure process, ongoing groundwater and surface water monitoring is still required under the Massachusetts Department of Environmental Protection (MassDEP) to demonstrate that the groundwater is in compliance under the Massachusetts Contingency Plan (MCP) and for post closure monitoring for the Beneficial Use Determination (BUD) Area and the Southeast Construction Fill Area (SCFA). This report presents the findings from samples collected in March 2008 in support of the Site closure requirements under the MCP and to support post closure monitoring.

2.0 BACKGROUND

Through the site closure process, a comprehensive investigation was conducted to characterize environmental conditions and to develop the conceptual site model, not only to identify source areas and impacted media, but to also describe the fate and transport of both chemicals and radionuclides in soils, groundwater, and surface water. These findings have been published in numerous reports and have achieved the appropriate regulatory approvals. The conceptual site model for groundwater at YNPS was published in the Final Groundwater Conditions Report, submitted to the NRC on February 15, 2007.

As part of the Decommissioning Project, 81 groundwater monitoring wells were installed to characterize the hydrogeology as well as groundwater quality. Currently there are 53 wells that remain on Site. Of these wells, 15 groundwater monitoring wells are to be sampled to demonstrate compliance with the MCP and to support post closure monitoring. As recommended below, the remaining 38 wells may now be abandoned as not to become a potential conduit for surface runoff to impact groundwater conditions.

3.0 SCOPE OF WORK

Groundwater monitoring for closure under the License Termination Plan (LTP) has been completed. However, groundwater monitoring is still required to reach closure under the MassDEP and to support post closure monitoring, and as such, this program was completed in accordance with the MassDEP-approved Groundwater Monitoring Plan to Support Closure under the MCP (ERM, 2007).

The sampling program included the sampling of 15 groundwater monitoring wells and six surface water sample locations. The sampling program is summarized in Table 1. The sampling locations are shown on Figure 1. All groundwater samples were collected in accordance with Low Stress (Low Flow) Purging and Sampling guidance (USEPA, 1996a). Field data records are presented in Appendix A and a summary of the field data parameters is presented in Table 2.

The radiochemistry data were validated in accordance with Site Procedure RP-05. Chemical analytical data were validated in accordance with USEPA Region 1, New England Validation Guidelines (USEPA, 1989 and 1996b). A summary of the data validation findings and tabulated validated data are provided in Appendix B-1 (radiological), B-2 (chemical), and B-3 (validation checklists).

4.0 FINDINGS

Groundwater samples were submitted for both radiological and chemical parameters.

4.1 RADIOLOGICAL PARAMETERS

Radionuclides in groundwater are compared to the U.S. Environmental Protection Agency's (USEPA's) Maximum Concentration Limit (MCL). In addition to these criteria, data are also evaluated over time to assess if trends are decreasing, stable, or increasing. A change of 15 percent from the Spring 2007 event has been used to evaluate trends.

Groundwater samples were collected from 10 monitoring wells and one surface water location (Sherman Spring) for analysis of radionuclides. Consistent with previous events, tritium was the only radionuclide positively identified in groundwater. The results from the March 2008 sampling

event are presented on Table 3 along with previous data to demonstrate that there continues to be a generally downward and/or stable trend in tritium concentrations. Radionuclides were not detected in the sample collected at the Sherman Spring monitoring location this event.

As anticipated, the highest concentration of tritium was detected at MW-107C at 25,700 picocuries per liter (pCi/L), with the next highest detection reported at monitoring well MW-107F (9,890 pCi/L). The MCL for tritium is 20,000 pCi/L. As shown on Table 3, these detections are consistent with the conceptual site model; tritium remains elevated at a few locations; however, the concentrations are generally trending downward. Additionally, because the source was removed as part of Site Closure, this trend is anticipated to continue over time.

4.2 CHEMICAL PARAMETERS

Groundwater chemical data are evaluated using the GW-1 groundwater standards (310 CMR 40.0974(2)) (MassDEP, 2008). For the analyses where GW-1 standards are not published, data are compared to Massachusetts MCLs or Massachusetts Secondary MCLs (SMCLs) (MassDEP, 2007). Surface water chemical data are evaluated using USEPA Ambient Water Quality Criteria (AWQC) (USEPA, 2002). For the analyses where AWQC are not published, data are compared to Massachusetts MCLs or SMCLs (MassDEP, 2007).

Former Industrial Area All but three of the monitoring wells (CFW-1, CFW-5 and CFW-6) that are sampled for chemical parameters are located in the Former Industrial Area. None of the surface water sampling locations are within the Former Industrial Area. Groundwater samples collected from wells in the Former Industrial Area were analyzed for arsenic and acetone. Monitoring well MW-101C was analyzed for acetone and monitoring wells MW-101A, MW-107A, and MW-111C were analyzed for arsenic.

- Acetone was detected at MW-101C at a concentration of 2.20 mg/L, below the MassDEP GW-1 standard of 6.3 mg/L.
- Arsenic was detected at MW-101A at a concentration of 0.01 milligrams per liter (mg/L), which equals the MassDEP GW-1 standard.
- Arsenic was not detected in samples collected from monitoring wells MW-107A and MW-111C.

A summary of the acetone data from monitoring well MW-101C is presented on Table 4. A summary of arsenic data from monitoring wells MW-101A, MW-107A, and MW-111C is presented on Table 5.

Former Southeast Construction Fill Area Samples were collected from three groundwater monitoring wells (CFW-1, CFW-5, and CFW-6) and five surface water locations (SW-1 through SW-5) to assess the potential environmental impacts from the Former SCFA. A summary of the sampling program is presented in Table 1.

No volatile organic compounds (VOCs) were detected in any of the groundwater or surface water samples at concentrations greater than the screening values. Several metals and other naturally occurring compounds were detected in both groundwater and surface water samples; however, the concentrations are consistent with background and historic data with the exception of a few parameters reported for CFW-6. Only iron and manganese were detected at concentrations that exceed the SMCLs. SMCLs are used to assess the aesthetic qualities of drinking water and are not health-based standards. Concentrations that exceed SMCLs are not necessarily indicative of potential health risks.

A summary of the groundwater data for wells downgradient of the SCFA is presented on Table 6. A summary of the surface water data for locations associated with the SCFA is presented in Table 7.

Sherman Spring Sampling was completed at the Sherman Spring surface water location (SP-1) and samples were analyzed for VOCs and total RCRA 8 metals plus thallium. All results were reported as not detected. Validated data is included in Appendix B.

5.0 CONCLUSIONS

Based on the data collected during the March 2008 sampling event, tritium continues to be the only site related radionuclide impacting groundwater and/or surface water at YNPS. Tritium concentrations continue to be stable or decreasing across the site, with the highest concentration reported at MW-107C at an activity of 25,700 pCi/L compared to the MCL of 20,000 pCi/L.

Acetone was detected at MW-101C below the GW-1 standard. In accordance with the Groundwater Monitoring Plan, samples must be collected from this well until there are two consecutive rounds of data that are below the GW-1 standard of 6.3 mg/L. Based on the data presented in Table 4, monitoring at well MW-101C may be discontinued.

Arsenic was detected at MW-101A at the GW-1 standard. In accordance with the Groundwater Monitoring Plan, samples must be collected from the three wells until there are two consecutive rounds of data that are below the GW-1 standard of 0.01 mg/L. Based on the data presented in Table 5, sampling will continue for wells MW-101A and MW-111C. Monitoring at well MW-107A may be discontinued.

Groundwater results reported for CFW-6 were not consistent with historical results for some (not all) parameters. Results obtained from this location during the next event (March 2009) will be reviewed and evaluated for potential trends.

6.0 RECOMMENDATIONS

The results from the March 2008 groundwater sampling event were consistent with the approved conceptual site model. No additional sampling is warranted at this time. In accordance with the Post Closure Groundwater Monitoring Plan, the next groundwater and surface water sampling event is scheduled for March 2009.

As the groundwater monitoring program is progressing, wells that are no longer part of the active network may also be abandoned at this time. This action is recommended to eliminate the conduit for storm water runoff to potentially reach the water table. Wells should be abandoned by a Massachusetts licensed driller in accordance with state regulations.

**Data Validation Summary
Yankee Nuclear Power Station
Rowe, Massachusetts
SDG: 3Y-YR-001**

Introduction:

Twelve groundwater samples and one equipment blank were collected March 24, 2008 through March 26, 2008, at the Yankee Nuclear Power Station, located in Rowe, Massachusetts. The samples were analyzed for one or more of the following parameters: Tritium by Liquid Scintillation, Strontium-90 by GFPC, and Gamma Isotopes (Co-60, Cs-134, Cs-137, Nb-94, Sb-125, Eu-152, Eu-154, Eu-155, and Ag-108m) by Gamma Spectroscopy. Sample analyses for all parameters were performed by GEL Laboratories, LLC, located in Charleston, South Carolina.

A chemist review was performed on all samples and analyses using information supplied by the laboratory. The data package was validated using SAIC guidance – “Laboratory Data Validation Guidelines for Evaluating Radionuclide Analyses” (April 2002), DOE Guidance – “Evaluation of Radiochemical Data Usability” (April, 1997), and the Yankee Nuclear Power Station Groundwater Monitoring Program, Document RP-05 (September 13, 2007).

The following samples collected during March 2008 are included in the data evaluation:

Field Sample ID	GEL ID	Sample Date	Comment
CFW-5	205621013	3/26/08	Tritium
CFW-6	205621001	3/25/08	Tritium
MW-102D	205621002	3/26/08	Tritium, Sr-90, Gamma
MW-104A	205621003	3/25/08	Tritium, Sr-90, Gamma
MW-105B	205621004	3/26/08	Tritium, Sr-90, Gamma
MW-106A	205621005	3/26/08	Tritium, Sr-90, Gamma
MW-107C	205621006	3/25/08	Tritium, Sr-90, Gamma
MW-107D	205621007	3/24/08	Tritium, Sr-90, Gamma
MW-107E	205621008	3/24/08	Tritium, Sr-90, Gamma
MW-107EDUP	205621009	3/24/08	Tritium, Sr-90, Gamma
MW-107F	205621010	3/24/08	Tritium, Sr-90, Gamma
SP-1	205621011	3/26/08	Tritium, Sr-90, Gamma
EB-001	205621012	3/24/08	Tritium, Sr-90, Gamma

Data were evaluated for the following parameters:

- * Collection and Preservation
- * Holding Times
- * Data Completeness
- * Tracer Recoveries
- * Blank Contamination
- * Duplicates
- * Laboratory Control Samples
- * Matrix Spike/Matrix Spike Duplicates
- * Target Compound Quantitation
- * Miscellaneous

* - all criteria were met for this parameter

With the exception of the following items discussed below, results were determined to be usable as reported by the laboratory.

Target Compound Quantitation

Gamma – The suspected Niobium-94 radionuclide peak was detected in sample MW-105B, but failed to meet the positive identification criteria. The Nb-94 result in sample MW-105B was rejected by the laboratory due to the low abundance that resulted in the uncertain identification. The lab qualified the result with “UT” which was changed to “R” (rejected) during validation.

**Data Validation Summary
Yankee Nuclear Power Station
Rowe, Massachusetts
SDG: 3Y-YR-001**

Introduction:

Nine groundwater samples, five surface water samples, one equipment blank, and two trip blanks were collected March 24, 2008 through March 26, 2008, at the Yankee Nuclear Power Station, located in Rowe, Massachusetts. The samples were analyzed for one or more of the following parameters: volatile organic compounds (VOC), total metals, and wet chemistry parameters (cyanide, COD, nitrate, chloride, sulfate, TDS, and alkalinity). Sample analyses for all parameters were performed by Northeast Laboratory Services (NEL), located in Waterville, ME.

A chemist review was performed on all samples and analyses using information supplied by the laboratory. The data package was validated using Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996), Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses (USEPA, 2004), and Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses (USEPA, 1989), and the Yankee Nuclear Power Station Groundwater Monitoring Program, Document RP-05 (September 13, 2007).

The following samples collected during March 2008 are included in the data evaluation:

Field Sample ID	NEL ID	Sample Date	Comment
CFW-6	AK03044	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
SW-1	AK03045	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
SW-3	AK03046	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
SW-4	AK03047	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
SW-5	AK03048	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
MW-107A	AK03049	3/24/08	Arsenic
EB-001	AK03050	3/24/08	Equipment Blank: VOC
TB-001	AK03051	3/25/08	Trip Blank: VOC
SW-2	AK03134	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
CFW-1	AK03135	3/25/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
CFW-5	AK03136	3/26/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
CFW-5DUP	AK03137	3/26/08	VOC, metals*, cyanide, COD, nitrate, chloride, sulfate, TDS, alkalinity
SP-1	AK03138	3/26/08	VOC, RCRA 8 metals + thallium
MW-101C	AK03139	3/26/08	Acetone
TB-002	AK03140	3/26/08	Trip Blank: VOC
MW-101A	AK03201	3/26/08	Arsenic
MW-111C	AK03202	3/26/08	Arsenic

* Metals include – RCRA 8 (arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver) + copper, iron, manganese, zinc, calcium, sodium

Data were evaluated for the following parameters:

- * Collection and Preservation
- * Holding Times
- * Data Completeness
- * Surrogate Recoveries
- * Blank Contamination
- Duplicates
- Laboratory Control Samples
- Matrix Spike/Matrix Spike Duplicates
- * Serial Dilutions
- * Target Compound Quantitation
- * Miscellaneous

* - all criteria were met for this parameter

With the exception of the following items discussed below, results were determined to be usable as reported by the laboratory.

Duplicates

Metals – The laboratory duplicate associated with sample CFW-5 reported a relative percent difference between iron (29) results that was greater than the control limit of 20. Iron results, in samples of a similar matrix, were qualified as estimated. The results for iron in samples CFW-6, CFW-5, CFW-5DUP, and CFW-1 were positive and were qualified as estimated (J).

Laboratory Control Samples

VOC – The LCS/LCSD, associated with samples CFW-5 and SP-1, reported percent recoveries for 2-butanone (54, 55) and bromoform (29, 29) that were below the laboratory control limit of 60-140 indicating a potential low bias. The results for 2-butanone and bromoform were non-detect in samples CFW-5 and SP-1 and were qualified as estimated (UJ).

Metals – The LCS/LCSD associated with all metals samples in the SDG reported percent recoveries for silver (78, 78) that were below the laboratory control limit of 85-115 indicating a potential low bias. In addition, the percent recoveries for arsenic (119, 118) and iron (119, 116) were greater than the laboratory control limit of 75-115 indicating a potential high bias. The results for silver were non-detect in samples CFW-6, SW-1, SW-2, SW-3, SW-4, SW-5, CFW-1, SP-1, CFW-5, and CFW-5DUP and were qualified as estimated (UJ). The results for iron in these samples were all positive and were qualified as estimated (J). The result for arsenic was positive in sample MW-101 and was also qualified as estimated (J).

Matrix Spike/Matrix Spike Duplicate

VOC – The MS/MSD associated with sample CFW-5 reported percent recoveries for bromoform (32, 33) that were below the laboratory control limits of 60-140 indicating a potential low bias. The results for bromoform in samples CFW-5 and CFW-5DUP were non-detect and were qualified as estimated (UJ).

Metals – The relative percent difference between the matrix spike and matrix spike duplicate associated with sample CFW-5 was greater than the control limit of 20 for silver (36). Silver results, in samples of a similar matrix, were qualified as estimated. The results for silver in samples CFW-6, CFW-5, CFW-5DUP, and CFW-1 were non-detect and were qualified as estimated (UJ).

NOTE

- | | |
|-----|---|
| 1.0 | FS = Field Sample, BL = Blank, QC = Lab Quality Control. DU = Duplicate, SK = Spike |
| 2.0 | Reported MDC <= Required MDC for FS, DU, BL. Yield for all samples evaluated when reported. |
| 3.0 | Requirements for SK, DU, and QC per section D. |

I. All Requested analyses performed on all samples? X Yes _____ No

II. Resolution of Sample Processing/Missing Analytes comments:

The suspected Niobium-94 radionuclide peak was detected in sample MW-105B, but failed to meet the positive identification criteria. The Nb-94 result was rejected by the laboratory due to the low abundance and uncertain identification. The lab qualified the result with "UI" which was changed to "R" (rejected) during validation.

III. Resolution of Sample Processing/Missing Analytes comments:

One or more compounds in samples MW-104A, MW-105B, Mw-106, MW-107D, MW-107E, and MW-107EDUP did not meet the required uncertainties identified in document RP-05. All MDC requirements were met. See attached checklists for additional information.

IV. Resolution of Anomalies in QC, Duplicates, Spikes, or Blanks (Identified above):

No qualifications required. See attached checklists for details.

V. Data verification calculation sheets are attached(at least one calculation per batch) NA

ATTACHMENT E

**YANKEE NUCLEAR POWER STATION
SITE CHARACTERIZATION QUALITY ASSURANCE PROGRAM PLAN FOR
SAMPLE DATA QUALITY**

Identify analytes individually

Sample	Analyte	Date	Reject, Resample or Reanalyze	Brief Description
MW-105B	Niobium-94	4/3/08	Reject	Uncertain Identification

- I. Identify the specific reason for rejection of sample result, resample or reanalysis requirements (this should include a description of why the data point for that analyte may/may not be omitted):

The suspected Niobium-94 radionuclide peak was detected in sample MW-105B, but failed to meet the positive identification criteria. The Nb-94 result was rejected by the laboratory due to the low abundance which resulted in the uncertain identification. Due to this uncertainty, the result should be omitted and not used in any data analysis.

- II. Are other analytes from this sample affected? Explain

No other analytes from this sample were affected.

- III. Are changes to the procedures for sampling, preservation, transport, analysis or assessment required (review AP-9601 for any specific program requirements)? Explain specific changes.

No procedural changes are necessary. The issue noted above was random and was not the result of any procedural issues.

REGION I TIER II VALIDATION CHECKLIST
Criteria and Qualifiers: Region I Guidelines (6/13/88 Modified 2/89)
INORGANIC

SITE: Yankee Rowe Project #: 3617087152/ Box #: AK 030, AK031,
02.01 AK032

Sample IDs: See attached tracking sheet or samples listed:

CFW-6, SW-1, SW-3, SW-4, SW-5, MW-107A, SW-2, CFW-1, CFW-5,
CFW-5DUP, SP-1, MW-101A, MW-111C

YES	NO	VALIDATION CHECK	NONCOMPLIANCE NOTES
<input checked="" type="checkbox"/>	<input type="checkbox"/>	Hold Times Met	Attach list of samples which exceed hold times. Indicate <u>total</u> hold time and qualifiers.
<input checked="" type="checkbox"/>	<input type="checkbox"/>	Samples preserved	
Data Completeness			Comments on missing information (if any) and action taken.
<input checked="" type="checkbox"/>	<input type="checkbox"/>	Cover page, Forms I - XIV, DC-1, DC-2, and raw data.	
<input checked="" type="checkbox"/>	<input type="checkbox"/>	Original shipping and receiving documents	Chain of Custody
<input checked="" type="checkbox"/>	<input type="checkbox"/>	Lab records of sample transfer, preparation and analysis	Internal laboratory chain of custody
Calibration			
<input type="checkbox"/> <i>NA</i>	<input type="checkbox"/>	Appropriate number of standards used to establish calibration curve.	ICP: at least one blank and one standard AA and CN: at least one blank and three standards, with one standard at the CRDL for AA.
<input type="checkbox"/>	<input type="checkbox"/>	Correlation coefficient > 0.995.	Hg: at least one blank and four standards Correlation coefficient criteria applicable to all analyses except ICP
<input type="checkbox"/>	<input type="checkbox"/>	Calibrated daily.	If correlation coefficient is not acceptable, discuss deficiencies, affected samples and action taken.
<input type="checkbox"/>	<input type="checkbox"/>	CRI/CRA analyzed at the proper frequency in the analytical run sequence.	See method.
<input type="checkbox"/>	<input type="checkbox"/>	CRI/CRA %R within acceptance range.	No acceptance range dictated by CLP methods or National Functional Guidelines. See regional guidelines for guidance.
<input type="checkbox"/>	<input type="checkbox"/>	ICV/CCV %R within acceptance range.	90-110% for ICP, 85-115% for CN, 80-120% for Hg
<input type="checkbox"/>	<input type="checkbox"/>	CCVs analyzed at the proper frequency.	Every 10 samples or every 2 hrs.
<input type="checkbox"/>	<input type="checkbox"/>	Traceable ICV source.	Attach copy of Form II (2A) for all noncompliant ICVs and CCVs. Circle non-compliances and indicate qualifiers.

OK per case narrative

REVIEW OF CHAIN OF CUSTODY AND SAMPLE DOCUMENTATION

**SDG: 3Y-YR-001
(NEL Sample #: AK03044-51)**

Sampling Event Date(s) 3/24/08 – 3/25/08 Shipment Date 3/25/08

Wells Sampled in this Batch:

- I. All samples identified on COC forms? X Yes _____ No _____
- II. Samples obtained match those required by sampling plan? X Yes _____ No _____
- III. Verification of unbroken chain of custody for samples? X Yes _____ No _____
- IV. Samples received intact by laboratory? _____ Yes X No _____
- V. Sample flush volumes and flow parameters consistent with historical data and acceptable?
✓ Yes _____ No _____
- VI. Sample non-radiological parameters consistent with historical data and acceptable?
✓ Yes _____ No _____
- VII. All preservative and container requirements met? X Yes _____ No _____
- VIII. Samples obtained match those required by sampling plan? X Yes _____ No _____
- IX. Evaluation for accepting sample for any questions I - VIII answered "NO" (indicate if resample will be done prior to shipment):

One VOA vial associated with sample SW-3 was found broken upon receipt. All other VOA vials associated with this sample arrived intact and were used for analysis.
